

Adrián Arsenio Garcés Jiménez

BACKEND DEVELOPER · JAVA & SPRING BOOT

PROFESSIONAL PROFILE

Self-taught Backend Developer specialized in Java 21 and Spring Boot. I design and ship production software end to end: an Open Source library on Maven Central and distributed systems using microservices and Apache Kafka, applying SAGA and Circuit Breaker patterns to ensure consistency and idempotency under failure. My focus is on measurable outcomes and owning the full development cycle — from architecture to deployment — not just knowing technologies in isolation.

SKILLS

Languages & Frameworks	Java 21+, Spring Boot, Spring Security, Spring Data JPA, Spring Cloud, NestJS (TypeScript), React
Architecture	Microservices, Apache Kafka (event-driven), Clean Architecture, SAGA pattern (choreography), Circuit Breaker (Resilience4J)
Security	Designing complete authentication, authorization and audit schemes; OAuth2 (Authorization Code + token relay), SAML/OAuth2 standards, identity management (IAM)
Data	PostgreSQL, MySQL, domain modeling with JPA
Tools	Docker, Docker Compose, Git/GitHub, API documentation with OpenAPI, CI/CD
Soft Skills	Open source collaboration (maintaining a library with external contributors), distributed problem solving, demonstrated self-directed learning (Java, Spring, Kafka and cloud-native patterns alongside full-time studies)

FEATURED PROJECTS

Prompt Link

JAVA 21 · SPRING BOOT 4 · MAVEN CENTRAL

Reusable Java client for generative AI (OpenRouter: GPT-4, Claude, Llama) with Spring Boot auto-configuration, published on Maven Central under the MIT license.

- Designed the auth interceptor to live only inside the OpenRouter Feign Client's context, preventing the API key from leaking into other Feign clients of the consuming application.
- Implemented typed error handling (AiClientException) distinguishing HTTP errors, network failures, invalid responses and configuration errors via custom status codes (-1 to -4).
- Added token streaming over WebFlux (Flux<String>) and configurable retries with exponential backoff; released version 1.1.0 with 22 commits and 1 external fork.
- Documented in the changelog a critical security fix (API key leak between Feign clients) found and fixed in version 1.0.3.

FinanceTracker Monolith-API

JAVA 21 · SPRING BOOT · POSTGRESQL · IA

Personal finance API integrating **Prompt Link** (my own library) for automatic expense analysis, categorization and a conversational financial assistant.

- Modeled the User → Account → Transaction domain with strict data isolation and generated dynamic monthly/yearly financial reports on a layered architecture (controller, service, repository, entity, dto, mapper, security, exception, handler).
- Secured the API with JWT and Spring Security, and centralized global error handling in a dedicated handler/ layer with @RestControllerAdvice.
- Exposed 3 AI endpoints (automatic analysis, financial chat, expense categorization) consuming my own Prompt Link library in production, validating it in a real use case.

OrderFlow

MICROSERVICIOS · KAFKA · OAUTH2 · DOCKER

Order management platform with 8 microservices (Java 21, Spring Boot 4, Spring Cloud), asynchronous Kafka events and end-to-end OAuth2 security.

- Designed the order flow with a **choreography-based SAGA** pattern: Order → stock reservation in Inventory → Payment → confirmation or rollback, fully coordinated via Kafka events between services.
- Built a custom Authorization Server (OAuth2, Authorization Code flow) with the Gateway acting as an OAuth2 client that validates and forwards the JWT to internal microservices (token relay).
- Added Circuit Breaker (Resilience4J) to the product and inventory Feign clients, plus per-order idempotency via a UUID key to prevent duplicate processing.
- Integrated email notifications (MailHog), documented the API with OpenAPI/Swagger at the Gateway, and orchestrated all 8 services (discovery, gateway, auth, user, product, inventory, order, payment, notification) via Docker Compose (Kafka + Zookeeper).

More projects (including **ChallengeHub**: a gamification API with JWT and role-based access control) available at adrian0511.dev and github.com/adrian0511
